

Three ways to access Windows®

SuperNova gives you speech, magnification AND full Braille support.

SuperNova from Dolphin is the ultimate access software, unique in giving you three magnificent ways to access Windows in the workplace.

You choose your method of working – speech, Braille, magnification, or a combination of all three. Whatever suits you best.

So whether you're writing or reading documents, browsing the internet or sending email; with SuperNova, you've got flexibility and choice.

- Use the screen reader alongside the magnification, so that text is easier and quicker to read or write. Or just turn on speech for a boost if your eyes start to tire in the afternoon.
- Magnify up to x60, so you can enlarge...and enlarge...as the day goes on. Image smoothing will minimize any jagged edges.
- Relax those tired eyes and avoid redness and headaches, by setting colors that are much more comfortable to work with and reduce glare.
- See instantly which part of the screen you are working on, as you can enlarge it even further in a small panel using focus highlighting.

● Braille user? SuperNova supports a wide range of refreshable Braille displays (Grades 1 or 2), including Braille keyboard input on supporting devices.

SuperNova is suitable for either home or office. And in larger organizations, schools and companies it can be loaded onto a server or network so that a user has the freedom to access it on any PC on site. It's powerful, reliable, all-in-one access software that's designed to make your work life easier and give your productivity a boost.

Does your workplace use more proprietary applications?

SuperNova allows you to write your own map files so that your access software will work seamlessly with them. No programming experience needed.

'At Nationwide we have found that Dolphin's SuperNova gives our staff with visual difficulties the flexibility to continue in their chosen careers by taking advantage of advances in information technology.'

Dolphin's range of Computer Access Software

Access software to transform your life

With Dolphin access software on your PC or laptop, you gain the independence to work in the same ways as colleagues or friends.

All of our access software comes with a 30-day money back guarantee and full lifetime technical support by telephone or email. Updates are provided free of charge over the web.

See The Bigger Picture

A screen magnifier for partially-sighted users that's easier on the eyes

If you're looking for screen magnification, the sky's the limit with Lunar. With just a click on the easy-to-use toolbar, everything on screen will appear as double its usual size, with no need to adjust Windows settings to enlarge the text. Type remains smooth and clear, even up to very high levels of magnification. And Lunar's Color Changer makes working easy on the eyes, too. Reverse usual on-screen colors, so that text appears as white on a more restful black background. Or try out some of the other 20 built-in high contrast color schemes. There's sure to be one that's perfect for your sight.

When you quit Lunar, the desktop returns to the normal Windows settings – great if you share a PC. Yet when you open Lunar again, you'll find your own personal settings for text size, brightness, contrast levels and desktop colour are all ready and waiting for you – giving you more independence and making your computer easier to use.

Lunar is also:

- Quick and easy to install
- Fast, responsive, stable and reliable
- Doesn't need special configurations
- Compatible with the widest range of Windows applications
- Requires virtually no user training

To find out more or to order Lunar, call 1 866 797 5921 or visit www.YourDolphin.com where there are full details on features.

Need that bit extra?

The added speech of LunarPlus is ideal for tiring eyes by reading out on-screen icons and other text. This additional feature improves accuracy and efficiency in your computer work.

Screen Reader with Braille support

Hal is an incredibly versatile screen reader that is developing a strong reputation for its amazing ability to 'grow with you'. With Hal's powerful speech synthesizer, you don't have to see the screen to make full use of the Windows environment. Hal Screen Reader can tell you everything that's on-screen using speech or a refreshable Braille display (Grades 1 and 2). But what makes Hal really stand out is the way that it will grow with you. Start straight from the box with standard settings. Read a whole document with just one keystroke, and quickly learn its number pad based hot keys. Then as you get more familiar with Hal, you'll find you can change the settings quickly and easily to create a tailored screen reader that suits you in every possible way. Choose the level of verbosity, customize hot keys and select from a range of different voices, so that you can find one you really like.

Hal is also great for browsing the web, and unlike some screen readers, Hal is not fazed by complex text layouts and the huge variety of website structures. You'll grow to appreciate Hal's finer points, too – like the way it tells you something has changed on screen, such as a page number, or that an instant message reply is on its way. With the right technology, you can achieve more than you thought. And in Hal you have an advanced screen reader that's excellent value – and carries everything and more that you need to succeed. Hal also includes sophisticated tools that can be used to 'intelligently' train Hal to work with more proprietary software you may need at work or in your home.

To try Hal or find out more visit www.YourDolphin.com or call 1 866 797 5921.

Turn the printed word into Speech

Looking for an easier, more private way to read letters and other printed documents?

Cicero takes your computer and scanner and effectively turns them into a simple-to-use reading machine. Just place your text document on the scanner and Cicero will translate it into speech, or into a large print text document that can be edited on screen and viewed in colors that are easy on the eyes. Cicero also supports refreshable Braille displays, so you can scan in your letters and then read them in Braille, too.
